

# CS F212 DATABASE SYSTEMS 2024-25

## LAB 6 EXERCISE (Views and User Defined Functions)

Q1: 2 Marks

Q2: 3 Marks

Q3: 2 Marks

Q4: 3 Marks

1. A. Write a MySQL user-defined function to calculate the commission earned by a given salesman. The commission is **10% of the total sales** made by the salesman.

*This function takes the salesman\_id as input and returns the commission earned.*

1. B. Use the above function and write a query to display all information (salesman\_id, name, city, salary) and the commission of salesmen with **commission < 1000**.

---

2. A. Create a view **nameorders** to facilitate easy fetching of data using salesperson or customer name. The view should contain the following columns -

*order number, purchase amount, salesman ID, salesman name, customer name, level*

2. B. Write a query to display the contents of the above view.

2. C. Try inserting a new row in the **nameorders** view. Does this affect the parent table(s)? In either case explain why.

---

3. A. Using the view **nameorders**, create a user-defined function to calculate the **total purchase amount** of each customer.

*This function takes the customer's name as input and returns the total purchase amount.*

3. B. Write a query to display the name and total purchase amount of the customer '**Brad Pitt**'.

---

4. A. Create a view for those salespeople who belong to the city of **New York**.

4. B. Write a query to display all the records of the above view.

4. C. Insert the details of a new salesman

(ID: 107, Name: 'the rock', city: 'New York', salary: 3000)

in the above view. Does this affect the original salesman table? In either case explain why.
