

Lab Instructions

Notes:

1. Make sure each query ends with a semicolon. If you can't solve a question, write a semicolon as a placeholder and continue to the next one.
2. The test database will be available for download on Quanta only after you have submitted your answer file.
3. Don't break words or strings into new line, make sure a complete word stays in one line.

1. Rename Your Solution File

Rename the *studentID_Lab6.sql* file according to your BITS ID. (e.g.: *2024A7PS2020G_Lab6.sql*)

2. Load the Sample Database

From the **VS Code terminal** (opened with Lab6 folder), run the following commands to load the sample database into Lab6 database

```
chmod +x ./autochecker
./autochecker --load Lab6_db.sql
```

Warning: This command will completely reset the Lab6 database, overwriting any existing tables or data

3. Connect to MySQL and Lab6 database.

Open a new terminal and connect to the MySQL server.

```
mysql -u csf212 -p
#Enter password: csf212
```

Then use Lab6 database.

```
USE Lab6;
```

4. See the list of tables.

Run following command in MySQL to see list of tables that you will be working on today's Lab6.

```
SHOW TABLES;
```

5. Complete the Lab

Follow instructions and answer the questions from the question paper. Write your final queries in your renamed `studentID_Lab6.sql` file after testing them.

6. Check your SQL filename and number of semicolons

In your **VSCode terminal**, run :

```
./autochecker --check <studentID>

#E.g.
./autochecker --check 2024A7PS0001G
```

Your sql file should have correct name as `studentID_Lab6.sql` (2024A7PS0001G_Lab6.sql) and number of semicolons (that is number of queries).

6. Submit Your sql file (Only this file is evaluated)

Submit your *studentID_Lab6.sql* file to Quanta.

Self – Evaluation (After quanta submission)

1. Load the Test Database

After the submission deadline, a test database will be announced.

- Download the test database file from Quanta and place it in the Lab 6 folder.
- Load the test database by running the following command in your VS Code terminal :

```
./autochecker --load Lab6_test_db.sql
```

2. Evaluate and Create the Zip File

The zip generated here is not evaluated Run the following command to evaluate your solution and create a submission zip file.

```
./autochecker --zip <studentID> <studentID_Lab6.sql>  
#example  
./autochecker --zip 2024A70001G 2024A70001G_Lab6.sql
```
